

# How Do I Know If I Am Up to Date With the **COVID-19** Vaccine?

As of September 12, 2023, bivalent COVID-19 vaccines are no longer authorized by the U.S. Food and Drug Administration (FDA).

Anyone 5 years and older is considered “up to date” with COVID-19 vaccinations if they have received the most recent FDA-approved and recommended COVID-19 vaccine.

All adults ages 65 years and older can receive an additional vaccine dose, as recommended. CDC’s Respiratory Virus Guidance includes specific considerations for people who are at higher risk for severe illness, including people with weakened immune systems.

The updated COVID-19 vaccine protects against the current variants of SARS-CoV-2 and decreases risks of long COVID.

In addition to the virus that causes COVID-19, there are many other types of respiratory viruses, including flu and respiratory syncytial virus (RSV). The good news is there are actions you can take to help protect yourself and others from health risks caused by respiratory viruses.

**Please talk to your health care team about vaccinations if you are unsure of your status.**
