Cindy Warriner, BS, RPh, CDCES, Senior Consultant Pharmacist

Sepsis Matters!

What is Sepsis?

- "Sepsis is the body's extreme response to an infection.
- It is a life-threatening medical emergency.

Without timely treatment, sepsis can rapidly lead to tissue damage, organ failure and death."

How Does Someone Become "Septic?"

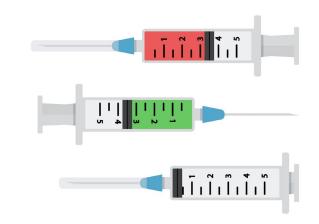

- Sepsis starts as an infection that gets into the blood stream, multiplies rapidly and travels quickly through the body.
- The body responds by sending WBCs, which causes extreme inflammation.

Infection **Prevention** is the Best Way to Prevent Sepsis

- Vaccinations are important tools in the fight against infections.
- Vaccinations can prevent illness by killing the infection-causing organism or minimizing the impact of the illness.
- Vaccinations are safer than hoping you will get the infection and develop immunity. You avoid the serious effects of the illness itself.

Best Practices:

- Obtain vaccination consent at admission
- Incorporate vaccination training into all staff onboarding

New Admissions or Vaccine Clinics: Co-administer Vaccinations to Catch Up

5 Vaccines Recommended for Adults 65 and Over:

- COVID Series: 47.6% are up to date
- Influenza Vaccine: 71.3% are up to date*
- Pneumococcal Vaccine: 63.4% have had*
- Shingles Vaccine: 45.7% have had**
- Tetanus: 65.1% have had within 10 years**

Note: Disparity with Vaccinations in Age>65:

Vaccine coverage <u>highest</u> for white adults (non-Hispanic) Vaccine coverage <u>lowest</u> for poor adults

Vaccinations prevent sepsis from common infections

Decrease Risk of Sepsis from Pneumonia: Vaccinate for Flu and Pneumonia

- Pneumonia is the leading cause of sepsis, causing 50% of episodes.
- 1.3 million **ED visits** have pneumonia as a primary diagnosis.
- Pneumonia is the second most common cause of infection in nursing homes.
- Pneumonia in NH residents may present as lethargy, confusion and falls, but also assess for more typical signs: cough, hypoxia, SOB, fever.

Pneumonia, respiratory infection and sepsis are usually listed as diagnosis or cause of death, not influenza – even if that is the original cause

Prevention of a Cascade of Illness Helps Prevent Sepsis

• Prevent debilitating illness from shingles or infected wounds from shingles to reduce the risk of infection and sepsis.

- Prevent pneumonia or severe pneumonia to reduce the risk of sepsis.
- Tetanus, a devastating illness from dirty wounds, is rare but it can cause preventable pneumonia and sepsis.
- Prevent respiratory infections from influenza, which can lead to sepsis.
- Prevent severe illness from COVID, including secondary infections caused by COVID, which can cause sepsis.

Why Vaccinate for Shingles in Nursing Home Residents?

- Incidence increases with age, by 50% in those over 85.
- The mortality rate is 5-15%, mainly a risk for the immunocompromised and elderly.
- The risk of complications, hospitalization, blindness and death from shingles increases with age.
- The risk of postherpetic neuralgia (severe pain from shingles) increases with age.
- The Shingrix vaccine is over 90% effective at preventing shingles.
- A COVID-19 infection increases the risk of shingles.

Shingles can present with fever, chills, diarrhea, burning sensation, malaise, headache.

Conduct a Performance Improvement Plan

Step 1: Determine the Key Areas for Improvement:

- Complete a medical records review for 8-10 residents who were transferred to the emergency department or admitted to the hospital with sepsis.
 - NOTE: You can choose a different number or timeframe based on your facility's usual patterns of transfer and readmission. Select a meaningful number to help identify any trends.
- Study documentation by the nurse and other staff. Review other areas, such as lab work, notes from the hospital and <u>vaccination</u> records. Note any diagnostic reasons or other patterns of interest (e.g., vital signs, staff involved, medical director, time of day, unit, staffing, etc.).
- Determine if there were missed opportunities that could have prevented the issue that led to the hospital transfer.

How to Find Vaccination Records

- Primary care provider offices and patient portals
- Local or usual pharmacy
- Previous post-acute facility
- State Immunization Registry
- Public health clinics
- Veterans Affairs records
- Local hospital systems and patient portals
- Insurance records
- Former employers
- Ask the patient and family to help

If this fails to produce answers, in many cases you may be able to give the vaccine but verify with the provider.
